

TechNote: Verdiem® SURVEYOR Wake on Web

With the recent growth in remote workers around the world, IT departments face the challenge of ensuring consistent and reliable remote access for these users. With remote users, a number of associated security and management challenges frequently arise, and can be even more complicated at companies that use a PC energy management solution. For SURVEYOR users, these challenges are addressed and resolved through the solution's Wake on Web feature, which gives organizations the power to implement an effective tool to reduce energy consumption while also addressing the needs of their remote workers.

How it Works

SURVEYOR's Wake on Web feature provides a mechanism for employees with SURVEYOR-enabled machines to wake their computers remotely.

This happens through visiting a published webpage where users can enter their machine name and then select to initiate a wakeup of their PC. This action triggers the SURVEYOR server to wake the selected PC so that the employee can use the established remote access mechanism to continue with the login procedure, ensuring minimal impact on the end-user.

Key Features

- Simple web interface to wakeup machines
- Leverages SURVEYOR's Wake on WAN feature to ensure successful wakeup across subnet boundaries
- Works with remote access technology like RDP or Citrix/ICA
- Works within the context of corporate security standards for remote access
- Can be branded with custom corporate logo

Key Benefits

- Establish corporate energy management policies that maximize savings without forcing PCs to stay on for remote access
- No need to identify and track users and machines that need remote access
- Increase employee productivity
- Reduce Help Desk calls and maintain business continuity
- Minimal administrative overhead – works seamlessly after setup

Product Requirements

- Internet Information Services (IIS) 5.1 or later
- ASP.Net 2.0 running on the IIS server
- SURVEYOR Server 5.0 or later
